

Multiparametric microvascular MRI: a cluster approach to characterize glioma

Nicolas Coquery

Grenoble Institut des Neurosciences – U836
Equipe 5: Neuroimagerie Fonctionnelle et Perfusion Cérébrale

nicolas.coquery@ujf-grenoble.fr

For solid tumors, several microvascular factors are relevant to:

- tumor diagnosis
- follow-up
- response to treatment

Some parameters can be obtained with MRI:

- apparent diffusion constant (**ADC**)
- cerebral blood volume (**CBV**)
- cerebral blood flow (**CBF**),
- integrity of the vascular wall:
 - area under curve after Gd-DOTA injection (**AUC_{Gd-DOTA}**)
- tissue oxygen saturation (**StO₂**)
- cerebral metabolic rate of oxygen (**CMRO₂**)
- ...

Parameter maps accumulation yields however some difficulty for interpretation

cluster-based approach to highlight the tissue structures
that exhibit similar physiological characteristic in two rat models of glioma

Methods – experimental design

Two orthotopic rat models of glioma:

C6 / Wistar rats

- n: 13 rats
- inoculation: 10^5 cells, 5 μ L, caudate nucleus
- days of imaging: 21-23 days
- mean tumor size +/- SD: 85.1 +/- 46.4 mm³

F98 / Fischer rats

- n: 13 rats
- inoculation: 10^3 cells, 5 μ L, caudate nucleus
- day of imaging: 22-24 days
- mean tumor size +/-SD: 104.9 +/- 28.0 mm³

Physiological control

- mechanical ventilation
- blood samples in femoral vein and artery before and after MRI
- similar pO₂ and pCO₂ between models

Multiparametric MRI

Magnet 4.7 T (Avance III console; Bruker)

Three regions of interest (ROIs):

- **tumor bulk** (n=3023 voxels; Wistar-C6=1500, Fischer-F98=1523)
- **contralateral striatum** (n=579 voxels; Wistar-C6=315, Fischer-F98=264)
- **contralateral cortex** (n=811 voxels; Wistar-C6=417, Fischer-F98=394)

Methods – MRI parameters

Six MRI parameters:

Apparent diffusion coefficient (ADC)

TR/TE = 3000/28.6 ms, b=900 s/mm²

Vascular integrity:

DCE imaging approach:

Lemasson et al., Radiology 2010

- multiple T1-weighted images; n = 60, 15.6 s per image; TR/TE: 800/4.2 ms
- bolus of Gd-DOTA (200µmol/kg)

-> Area Under Curve of Gd-DOTA ($AUC_{Gd-DOTA}$)

Cerebral blood flow (CBF)

continous arterial spin labeling (CASL)

Clément Debacker

- spin-echo EPI, TE=17.2 ms
- labeling duration = 4 sec, postlabeling delay = 0.2 sec, 20 pairs

Cerebral blood volume (CBV)

Steady state approach:

Valable et al., NMR Biomed 2008

- multiple gradient echo sequence; 26 echos TR/TE: 6000/3.5-78.5 ms
- bolus of P904 (200µmol/kg, Guerbet)

Tissue oxygen saturation (StO₂)

Computation with:

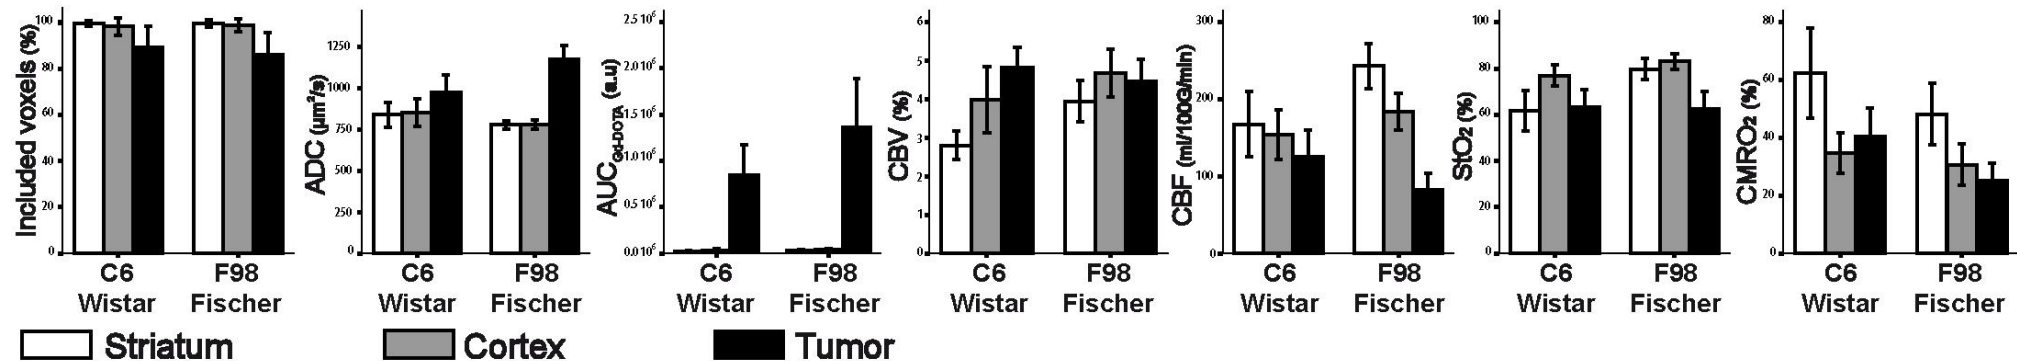

Lemasson et al., Radiology 2012

- CBV map
- 3D multiple gradient echo sequence; 25 echos TR/TE: 100/3-87 ms
- multiple spin echo sequence; 28 echos TR/TE: 2300/12-336 ms

Cerebral metabolic rate of oxygen (CMRO₂)

$$CMRO_2 = CBF \times (1 - StO_2/100)$$

Classical ROI-based analysis

- Similarities or heterogeneities between Wistar/Fischer rats, C6/F98 tumor models
- Mean measurement do not reflect disparities within ROI
- Loss of spatial information

Mclust-based Clustering approach

Cluster-based analysis

C. Fraley and A. E. Raftery (2002). *Journal of the American Statistical Association*

Normal mixture modeling: **Mclust**

Values **standardization** for scale effect minimization between parameters

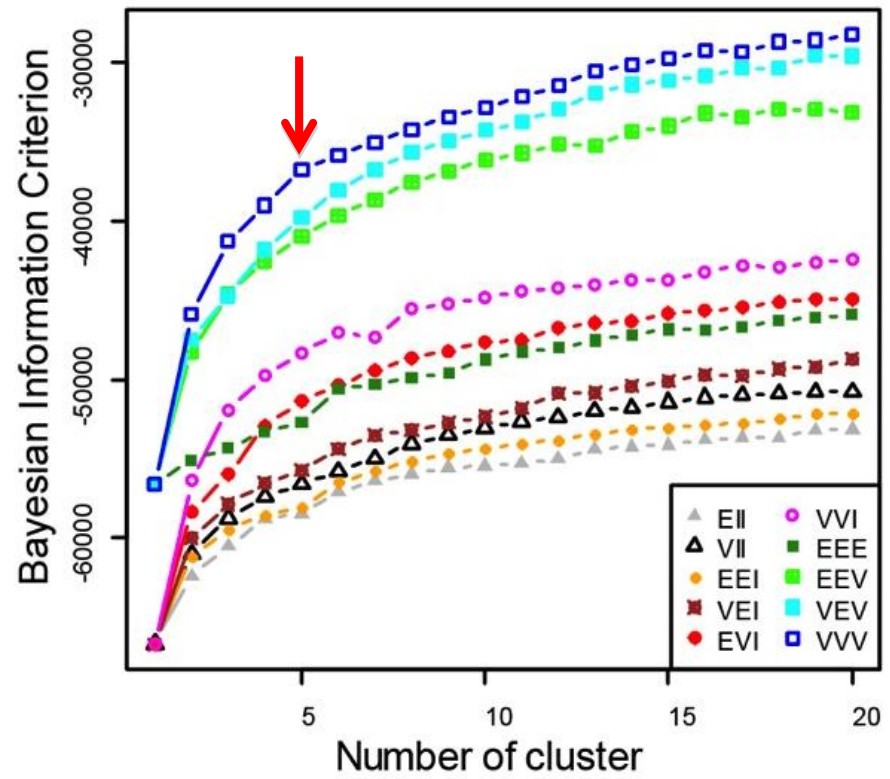

Allows **prediction** of new data set from built model

Model choice / optimal number of clusters > **Bayesian Information Criterion (BIC)**

Cluster number determination

5 clusters are sufficient to explain variability of the data set

Mclust : Gaussian Models-based clustering

Mclust-based Clustering approach

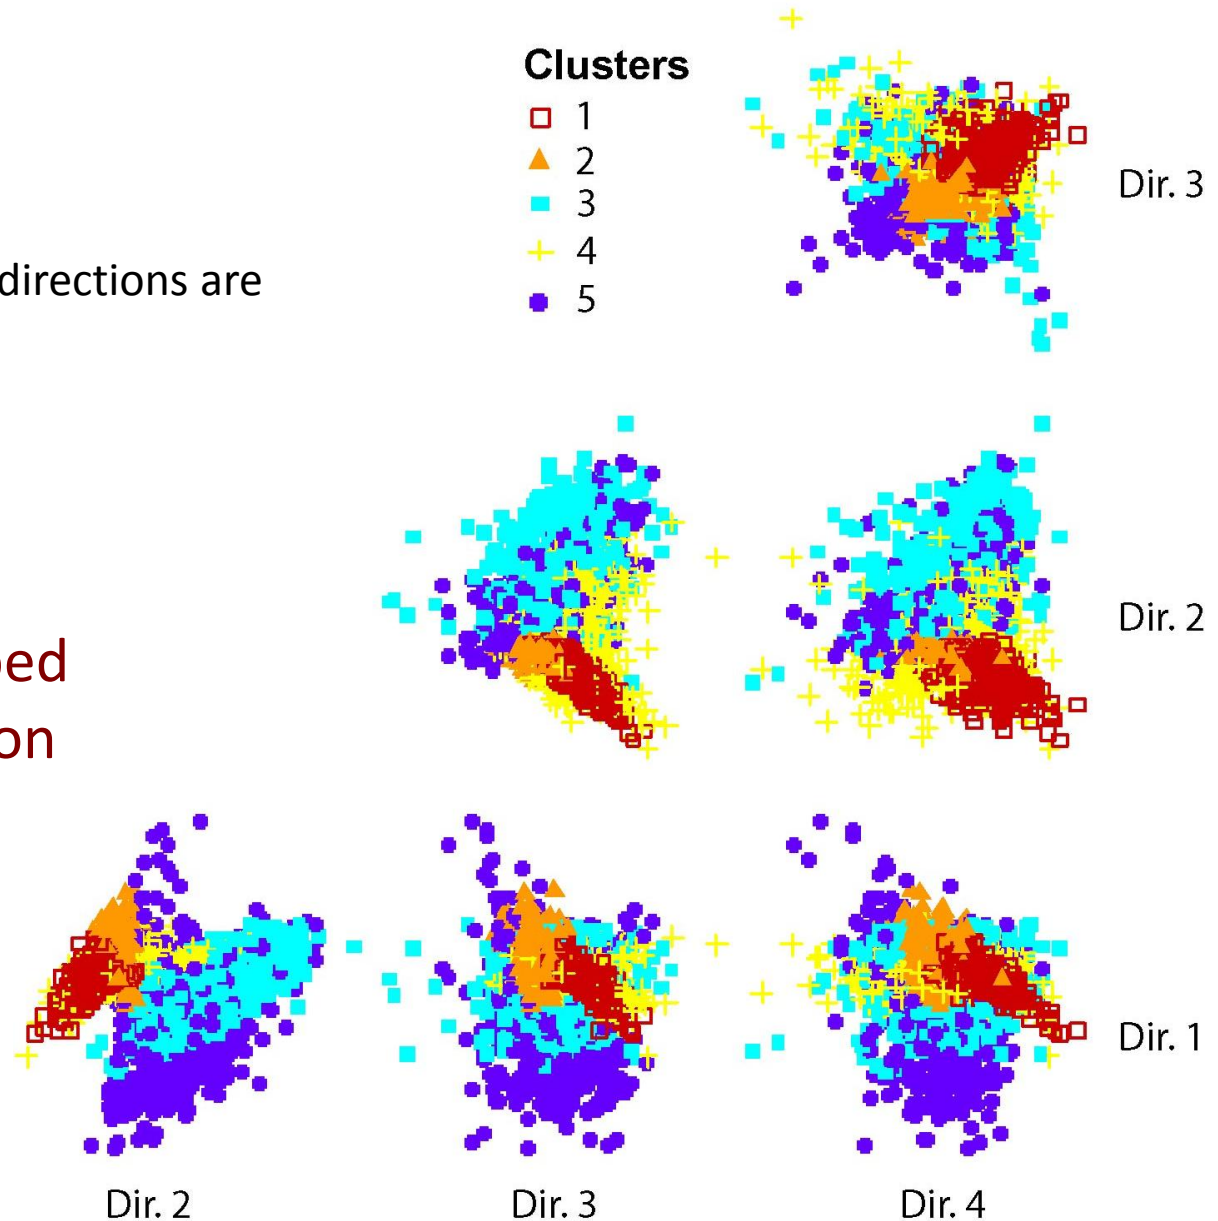

Clusters separation

Data reduction after clustering

Total of 6 directions

Cluster distribution in the 4 first directions are depicted

- > Clusters are well grouped
- > Good clusters separation

ROI distribution in each cluster

Cluster maps comparison

Clusters

- 1: Healthy specific
- 2: Healthy/Wistar specific
- 3: Tumor/F98 specific
- 4: Tumor specific (tendency toward C6 specificity)
- 5: Tumor specific

- Rat stem differences highlighted. Cluster 2 (orange) mostly presents in Wistar rat striatum
- Some healthy clusters present in drawn tumor ROI: partial volume, false positive tumor voxels
- Spatial organization of cluster in tumor

Conclusion/Perspectives

Conclusion

Normal Mixture model-based clustering:

- separates tumor tissue from healthy tissue
- shows cluster composition differences between C6 and F98 glioma models
- explain rat brain variability between rat stem
- highlight the spatial distribution of clusters within tumor

Perspectives

Preclinical research: effect of treatments on cluster composition
...detection of responsive/non responsive clusters

Clinical research (Julien Bouvier, PhD student):

- tumor localization
- diagnosis
- grades
